UI/UX and Workflow Specification

1. Principles

Keep the advisor focused on quote creation, status monitoring, result review and PDF export. Status must be communicated by text, not color alone. Manual results must never look like automated verified results.

2. Screens

Dashboard

Recent quotes, counts by status, New Quote action. No fabricated metrics.

New Quote

Customer/contact fields; product and coverage; one or more members; insurer selection; review/validation. Preserve input after errors and warn on unsaved changes.

Connect board

One card per insurer with connection state, session/reconnect action, run progress, safe error, retry/manual action. Sessions isolated by insurer.

Results

Premium only if valid; plan/cover; source (Auto/Manual); timestamp/freshness; warning; status. Partial results remain visible if other adapters fail. Cheapest highlight only among valid comparable quotes.

Manual entry

Insurer, plan, cover/sum insured, premium, currency, retrieval time, notes, optional screenshot, explicit manual confirmation.

History

Search/filter by customer/date; reopen; duplicate; regenerate PDF; delete quote and linked attachments according to retention policy.

PDF preview/export

Preview report, inspect brand/disclaimer, verify values/status/source, choose destination, warn about sensitive information.

Settings/first-run

Business logo/name/address/contact, approved licence/GST fields, disclaimer/consent, retention, output folder, credential-saving status, app version. Never display stored secrets.

3. User-facing states

- Running: “Checking this insurer…”
- Login required: “Sign in to continue.”
- OTP required: “Complete the OTP step in the insurer window.”
- Manual required: “This insurer needs manual handling. Enter the result after checking the insurer portal.”
- Failed: “We could not retrieve a valid quote. Review the details or use manual entry.”
- Completed: “Quote retrieved. Review the details before including it in the report.”
- Cancelled: “This insurer request was cancelled.”

- Blocked: explain that the app cannot continue automatically and offer the approved manual path.

4. Accessibility

Labels on all controls; logical keyboard order; visible focus; dialogs manage focus; readable contrast; long member lists remain usable; errors do not expose stack traces or sensitive data.
