Release and Build Runbook

1. Pre-release

- Confirm feature freeze and approved fix-only policy.
- Confirm version, release notes and known limitations.
- Run lint, typecheck, unit, fixture, integration, regression and production build commands defined in package scripts.
- Run secret scan; confirm no real customer data in package.
- Test DB migrations, first-run setup, retention and PDF assets.
- Confirm updater channel and signature verification if updater ships.

2. Windows

Build on a compatible Windows environment using the repository's configured packager and lockfile. Run tests/build, package installer, sign if required, verify checksum/provenance, install on clean Windows, run dummy quote/manual/PDF/history smoke, inspect sanitized logs.

Use `npm run build:win` only if that script exists in the current package.json.

3. macOS

Build on supported macOS/CI, package DMG/app using configured scripts, sign with approved Apple Developer identity, notarize/staple where required by distribution method, verify Gatekeeper behavior on clean supported Mac, test storage, secure storage, browser panes, OCR, PDF and update.

Use `npm run build:mac` only if that script exists in the current package.json.

4. Signing and secrets

Never commit certificates, private keys, app-specific passwords or signing tokens. Store signing material in approved secure CI/local storage with limited access. Track certificate expiry and owner.

5. Release artifacts

- Windows installer and checksum.
- macOS artifact and checksum.
- Version/release notes.
- Test summary and known limitations.
- User/install guides.
- Approved branding/disclaimer.
- Support contact and rollback plan.

6. Feature freeze

After freeze: no new features; only approved fixes. Every fix gets a regression test where practical. Rebuild and rerun impacted tests. Record build ID, artifact hashes and sign-off.

7. Rollback

Preserve previous approved installers. Do not overwrite user data during rollback. Hold auto-update if a critical defect appears. Confirm migration compatibility and recovery procedure before release.
