Operations and Troubleshooting Runbook

Diagnostic rules

Capture app version, OS, quote/run ID, insurer ID and sanitized error category. Never ask for passwords, OTPs, cookies or unredacted member records. Reproduce with dummy data/fixtures where possible.

Common issues

- **Portal does not load:** check network, portal availability, proxy/firewall and URL changes; do not retry aggressively.
- **Repeated login:** session may have expired or portal may require fresh sign-in; use approved reconnect.
- **OTP required:** advisor completes the OTP step.
- **CAPTCHA/security block:** stop automation and use manual handling; do not bypass.
- **Field not found:** portal may have changed; capture sanitized fixture, update parser and regression tests.
- **Premium parse failure:** do not guess or default to zero; mark review/manual.
- **PDF glyph/layout issue:** verify font assets, CSS, print settings and one/eight-insurer layouts.
- **SQLite error/history missing:** stop destructive actions; preserve permitted backup and use recovery procedure.
- **Secure storage unavailable:** no plaintext fallback; use approved manual login path.
- **Update failure:** verify artifact signature/version/channel and use approved rollback.

Severity

- P0/Critical: suspected data exposure, credential leak, corrupted data, misleading report. Stop use/release and escalate.
- P1/High: app launch/core quote/PDF broken broadly. Hold release or rollback.
- P2/Medium: one adapter unavailable but manual fallback works.
- P3/Low: cosmetic defect without correctness/security impact.

Incident process

1. Stop affected workflow if safety/data integrity is uncertain.
2. Record time/version/OS/run ID/insurer/error code.
3. Redact sensitive evidence.
4. Classify portal, auth, adapter, storage, PDF or packaging cause.
5. Reproduce with dummy data.
6. Fix and add regression test.
7. Rebuild and rerun impacted tests.
8. Document resolution and client communication.

Support bundle

May include version/platform, sanitized logs, run status and adapter versions. Exclude secrets and minimize customer data. Require user review before export.
